

Diagnostic Algorithm for Type 2 DM

Random B. Glucose

USING [laboratory venous] HBA1C IN DIAGNOSIS

An HbA1c of 48 mmol/mol (6.5%) is recommended as the cut point for diagnosing diabetes.

In patients without symptoms of diabetes repeat the HbA1c [2 results of ≥ 48 are then needed to make the diagnosis].

If the second sample is <48 mmol/mol (6.5%) treat as high risk and repeat the test in 6 months or sooner if symptoms develop.
